Notes: 10.34 inch mount spacing will give you .003 per MOA. For example if you adjust the rear mount 12 tic marks then that is 4 MOA. At 7.2 inch mount spacing it is .002 per MOA, so if you adjust the rear mount 5 tic marks that's 2.5MOA. The same goes for if you are adjusting the front mount. When getting your sight settings it is better to start at the Rams.
